Plant Health and Urban Forestry

Henrik Sjöman
Gothenburg Botanical garden / Swedish University of Agricultural Science
Trees and ecosystem services

(Deak Sjöman, 2016)
POTENTIAL AND CAPACITY OF ECOSYSTEM SERVICES

HEALTH, VIGOUR AND SIZE OF TREES
Challanges:

1. Develop knowledge and experience of different tree species capacity delivering ecosystem services

2. Develop knowledge and experience of different tree species capacity for different growing habitats
Challenges:

1. Develop knowledge and experience of different tree species capacity delivering ecosystem services

2. Develop knowledge and experience of different tree species capacity for different growing habitats

3. Develop knowledge of above mentioned categories on untraditional plant material
Limited diversity of urban trees

(Sjöman et al. 2012; Sjöman & Östberg, 2018)
Limited diversity of urban trees

(Sjöman et al. 2012; Sjöman & Östberg, 2018)
Asian Longhorned Beetles

Asian longhorned Beetle (*Anoplophora glabripennis*) = 137

Citrus Longhorned Beetle (*Anoplophora chinensis*) = 188

(Sjöman et al. 2014)
# Tree loss scenario in 10 Nordic cities

(Sjöman & Östberg, 2018)
Advice from literature?

Acer nigrum
- Heat and drought tolerant (Dirr 2009)
- Sensitive for heat and drought (Hightshoe 1988)
- Prefers sites that are more humid (Beaulieu 2003)
- Has a higher drought tolerance than sugar maple (Bassuk et al. 2009)

Acer negundo
- Useful for sandy, dry to sterile soil (Krüssmann 1982)
- Drought tolerant (Stoecklein 2001)
- Its native habitat is along streams and ponds (Grimm 2002)
- Native in moist habitats but perform well also in poor, wet, or dry habitats (Dirr 2009)
- Very heat and drought tolerant (Hightshoe 1988)
- Grows along shores of permanent bodies of water (Krüssmann, 1986)
- Like humid areas (Beaulieu 2003)
- Grows along stream banks, flood plains, swamps (Spellenberg et al. 2014)

(Sjöman et al. 2016)
Learning from nature
Functional Ecology
Leaf Economics

Schematic of *Tsuga heterophylla* needles grown in the sun (A) and shade (B) Two palisade mesophyll layers can clearly be seen in addition to the flatter, broader shade needle. (Tucker and Emmingham 1977 – Cited Kozlowski and Kramer 1997)

Plant strategists

(Grime 1979, 2002)
**C-strategists** are species that in the best and quickest way possible can assimilate the energy and space, both above and underground, and by doing so get an advantage through powerful growth.

These trees grow in habitats with high amounts of resources – water, nutrient etc. In drier and poorer habitats these species are less competitive.
S-strategists can be tolerant to one or several stress factors e.g. warm and dry habitats, cold temperatures, shade etc.
Ruderal species

R-strategists thrive in disturbed ecosystems where they can quickly establish themselves in young or disturbed vegetation system.
Plant strategists

(Grime 1979, 2002)
